Color can be adjusted with the eyedropper tool that can be found in the toolbox or with the use of eyedroppers (more on these later). The Curves tool allows you to easily adjust the brightness, contrast and colour balance of an image. The Dodge and Burn tools let you apply light or dark adjustments to certain areas of a photo without affecting others. The Eraser tool removes pixels by 'blowing' them away and is useful for correcting mistakes. Photoshop has a set of built-in tools that can be accessed with the button tool in the toolbox, or by pressing the 'tool' icon above the document window. When the button tool is selected in the toolbox, several types of brushes and pens will appear and change according to the brush or pen being selected. The buttons above the toolbox windows also change depending on the tool being used. Photoshop's Pen Tool is used to define and edit text, create geometric shapes, and draw lines and splines. The pen tool can be seen by holding down the 'P' key and placing the pen icon into the document window, when the brush is selected, or you can click the Pen icon on the toolbox. Tools Once a tool is selected, it will appear in the main toolbar (next to the layer and brush windows) and menu bar. The font size can be adjusted in the size menu, and by dragging in the document window. In the main toolbar, the tool can be dragged to change its position. Tool properties that are relevant to a tool's position, such as size, colour, opacity etc. are shown in the tool's main toolbar and menu. When a tool is selected, the brush will change colour according to the tool type (e.g. pencil, paint, eraser). In this section we'll look at the main functions of the most common tools, and how to use them. Applying an effect Effects are powerful tools that can be used to alter the look of images. Photoshop's effects are often referred to as adjustment layers, as they work in the same way, and effects are often created as adjustment layers. When an effect is applied to an image, the adjustment layer will appear as a translucent layer above the original. Brush dialog box The Brush dialog box contains a large variety of brush tool options. Brushes can be stored in either the Windows menu (under 'Brushes'), or the main menu (

`tf.multinomial(logits, num_samples, deterministic=False, dtype=tf.float32, name=None)` `{#multinomial}` Estimate the distribution for a given number of samples. `logits` must be `N1 * T` where `T` is the number of available samples. Assume a distribution with probability mass `m_i` in each of `C` available classes, such that `m_i / M_i = p_i`. Assume `z_i` is a sample of class `c_i`, drawn from the original (unknown) distribution (i.e. independent samples), and `y_i` is its label. The probability mass in class `c_i` is then given by: `c_i = y_i * m_i / M_i p_i = m_i / M_i` This function returns the probability that a draw `z` from the distribution has label `y` as a `N2 * T / C` tensor of shape `(N2, T)`.
