Among the advantages of the AA battery over other batteries include high energy density, high efficiency and no memory effect. However, the AA battery includes inorganic cells and the AA battery with Al, $AlCl_3$, Al_2O_3, $AlCl_4$, Al_2O_2 or $AlOCl_2$ as the positive electrode may have limited life due to a high order of potential reaction Al with oxygen gas (J. A. Becker, et al, "Electrochemical Cells and Their Applications", Marcel Dekker Inc., New York, 1996). A high potential of aluminum and the high order of potential reaction cause the aluminum to oxidize. The aluminum oxidation leads to formation of an insulating layer which not only blocks the electrode but also shortens the life of the AA battery. It is, therefore, necessary to develop the AA battery with aluminum as the positive electrode which does not encounter the aluminum oxidation. The inventors of the present invention have achieved the object of providing the AA battery with high energy density and high safety and have found that the AA battery comprising an alloy powder, an alkali aluminoborate having an average particle size of from 10 to 300 nanometers and 0.
