What's New in the Adobe Photoshop CC?

Q: Strange behavior with volatile in java I was having problems with the volatile keyword and static storage. The following code: public class Test { public static volatile int test; public void set(int value){ System.out.println("set"); test = value; } public static void main(String[] args) { Test obj = new Test(); obj.set(100); System.out.println(obj.test); } } results in: setting set 110 So, when the static variable test is read, its value is already set, which is ok. However, when the set() method is called, the value in the object is never updated, so it remains 100. I think this should be the default value for obj.test and obj.test should be set to 110 when the set() method is called, but this isn't the case. Why is this behavior happening? A: From the Java Language Specification section 8.3.1 (Volatile Fields): A volatile field can be assigned to while the field is being initialized. And: A local variable or parameter of type volatile-qualified class C can be assigned a value other than null while the variable or parameter is in a field declaration (§8.3.2.1, §14.4, §15.27.1.2, §15.27.3.1, §15.27.4.1, §15.27.4.2, §15.27.4.3, §15.27.4.4). The assignment occurs while the field is being initialized. When a method invokes the method declared in the final part of class Test: public static void main(String[] args) { Test obj = new Test(); obj.set(100); System.out.println(obj.test); } the method in this case is set, which is a void method. A method call is not a field access, and as such does not invoke a
