An agent can be seen as an independent learning entity, connected to a software system (not necessarily a human-computer one). This being said, an agent is an autonomous entity, that can perform its own research, in order to understand its environment and act accordingly. A general concept of a software agent was introduced by Ross Anderson in 1991, in the book "Adaptive Agents". In this book, he defined an agent as an entity, that is capable of autonomous learning and action, in order to interact with the environment, and act accordingly. The main assumption in agent-based software is that agents can use their internal resources to make decisions about how to act. An agent can be a human, an animal, an inanimate object or even a computer program. In recent years, the evolution of computer sciences resulted in the development of various agents that can be categorized into three classes: simple, complex and intelligent agents. Simple agents are based on few actions, as they have few decision-making capabilities. Their needs are simple, as they just rely on information that comes from the environment. Complex agents are based on the characteristics of the simple agent, but the decision-making can be more comprehensive. Intelligent agents are based on the characteristics of complex agents, as they can learn from the actions of other agents. These agents are classified into the following categories: 'Humanoids': Humanoids are the most powerful AI agents, as they are based on a brain, and are capable of thinking, reasoning, planning, decision making and of course, learning. 'Symbiotes': Symbiotes are the evolution of humanoids. They are capable of self-replication, self-learning, self-learning and self-replication, and they can be either 'advanced' or 'primitive'. 'Nililos': Nililos are sentient robotic entities that are capable of learning. They are simple AI agents, that can think, reason, decide, and they can also learn. 'Mammoth': Mammoth are the most powerful intelligent agents. They are capable of learning, decision making and self-replication. The following subsections will provide a brief introduction of the different types of agents and what they can accomplish: 'Humanoids' Humanoids are the most complex form of artificial intelligence. As a matter of fact, there are humans, dolphins and even animals such as ants, that are considered as 'humanoids'. The difference between a humanoid and a humanoid is that a humanoid is a computer program, that resembles
