* CreditAnalytics is designed as a Java-based, fully-featured financial fixed income credit analytics, trading, and risk library. * CreditAnalytics provides analytics to value liquid products (CDS, CDX, CDO, and bonds of all types and variants) and semi-liquid/custom products (single credit forwards and options, and portfolio credit forwards, options, tranches, and other structures). * CreditAnalytics provides a multi-currency framework. CreditAnalytics allows traders to examine derivatives using a trading framework where both sides of the derivative agree on the value of the product at a particular point in time. * CreditAnalytics provides a complete range of analytical tools to model various derivatives and to measure the market value of these derivatives. * CreditAnalytics is based on Java. For ease of integration, the application will work on a wide range of platforms. The application is currently compatible with Windows, Linux, and Unix operating systems. * The application is capable of producing a vast range of products and can easily be extended to analyze products with rapidly changing features. CreditAnalytics is designed as a Java-based, fully-featured financial fixed income credit analytics, trading, and risk library. It has been developed with a special focus towards the needs of the credit products community. In particular, CreditAnalytics provides analytics to value liquid products (CDS, CDX, CDO, and bonds of all types and variants) and semi-liquid/custom products (single credit forwards and options, and portfolio credit forwards, options, tranches, and other structures). CreditAnalytics Description: * CreditAnalytics is designed as a Java-based, fully-featured financial fixed income credit analytics, trading, and risk library. * CreditAnalytics provides analytics to value liquid products (CDS, CDX, CDO, and bonds of all types and variants) and semi-liquid/custom products (single credit forwards and options, and portfolio credit forwards, options, tranches, and other structures). * CreditAnalytics provides a multi-currency framework. CreditAnalytics allows traders to examine derivatives using a trading framework where both sides of the derivative agree on the value of the product at a particular point in time. * CreditAnalytics provides a complete range of analytical tools to model various derivatives and to measure the market value of these derivatives. * CreditAnalytics is based on Java. CreditAnalytics is designed as a Java-based, fully-featured financial fixed income credit analytics, trading, and risk library. It has been developed with a special focus towards the needs of the credit products community. In particular, CreditAnalytics provides analytics to value liquid products (CDS, CDX, CDO, and bonds of all types and variants) and semi-liquid/custom products (single credit forwards and options, and portfolio credit forwards, options, tranches, and other structures). Features: Streamlined API to read and write files, loops and functions. Real-time reporting using a detailed graphical display. Configurable reporting, including custom charts and ranges. Convenient options for data caching and consistency checking. Keyboard shortcuts and a configuration file for easy integration. Usability and customization: The UI is in the format of a visual report of calculation steps, and interactive demonstrations of the result for each step. Can be run from command line or in the application window. Features a customizable user interface, with an intuitive visual interface and keyboard shortcuts. Supports many text editors with compatible plugins. Options for data caching and consistency checking. Example applications: In credit risk management, CreditAnalytics can be used to provide the results of stress scenarios to traders and analysts, and to provide the basis for the forecasting of the level of stress for banks, insurance companies, and sovereign governments. For risk management, CreditAnalytics can be used to illustrate and test the dynamics of potential scenarios for a portfolio of products by changing the inputs and hypothesis assumptions over time, or over different risk factors (such as rating spreads). Can be used by commercial traders in an online environment, offering direct access to real-time calculation results. Can be used to provide the background processing for other applications, such as the calculation of a portfolio credit exposure. History: CreditAnalytics began as part of the Quandl project for automated download and updates of financial data from Yahoo! Finance. For more information about the origins of CreditAnalytics, and how it has evolved over the years, please visit the official website: www.creditanalytics.info. Stress Test is a software allowing you to simulate stress scenarios based on your data for the purpose of stress testing (looking at the effects of those scenarios on your portfolio). More precisely, Stress Test enables you to (a) calculate the effect of certain stress scenarios on your portfolio (b) 09e8f5149f

What's New In?

Rating: What is it and why should you care? Analytics: How to use it and what it means for your business. Methods: How to calculate Credit Default Swaps, Credit Default Swaps on Equities (CDXs), credit default swaps on synthetic instruments (CDXs on ABS, CDOs, CDX swaps), credit default swaps on credit other than ABS (CDXs on industrial and commercial loans, Alt-A loans, single-A loans, whole loan portfolios, hybrid loans, etc.), credit default swaps on synthetic credit (CDXs on tranches, on synthetics products), bond futures, bond portfolios, Credit Default Swaps on CDOs, CDOs on CDSs, etc. Search: Find Credit Default Swaps (CDs), CDXs, CDX options, bond futures, and bonds of all types and variants. If you want to know more about a particular instrument type, and you know which type you are looking for, simply click on that instrument type in the table below and you can find all the available instruments of that type. You can also select a region, a market type, a rating band or a credit rating for the Instruments. Synthetics: What are they? How can they help you? The CreditAnalytics gives you an accurate and detailed view of the underlying instruments you are using. For example, you can easily assess the credit quality and the risk of CDSs, CDOs, CDXs, CDX products, etc. even if you do not have the direct exposure to these underlying instruments. In order to do so, CreditAnalytics keeps track of a certain set of companies (that we call "gamma") that are part of the underlying instruments, which are more prone to default than average. We also keep track of a couple of distributions of gamma, which, in the case of these structured products, correspond to different rating classes. Each method allows you to access to three things: 1. An overview of the underlying instruments 2. Underlying instruments' gamma value for the instruments you are using 3. Underlying instruments' implied volatilities for the instruments you are using You can also customize the results of the CreditAnalytics by selecting the information that you are interested in from the existing tables, or you can use a predefined report in many cases. We invite you to download our trial version

System Requirements For CreditAnalytics:

Minimum: OS: Windows Vista, Windows 7, or Windows 8.0 Processor: 2.0 GHz Pentium 4 or AMD Athlon Memory: 1.0 GB RAM Graphics: 256 MB ATI Radeon HD 3470 or Nvidia GeForce GTS 450 Hard Drive: 5 GB available space Sound: DirectX 9.0 compliant sound card Additional Notes: If you are using a Mac, then it will NOT work.
