Adobe Photoshop Elements 1. Vector & Raster When you edit a picture, it is in vector or raster. Vector is shape-based and raster is pixel-based. Photoshop's vector and raster features are the same. The difference between them is that, in Photoshop, when you edit a picture, you have to use vector. In Elements, the two modes work the same. 2. File Types In general, Photoshop generates a file when you edit a picture. Photo files are for photos and all other image files are for other kinds of pictures. The folder where you put your pictures will depend on which program you use. File extensions determine the types of documents you can edit. TIFF is a standard extension for transferring and organizing digital photos. Photoshop Elements can edit TIFF files. JPEG, GIF and PNG are all image formats. Photoshop Elements can edit all of them. PNG is a simple, lossless compression format, used for many websites, computer programs and digital maps. JPEG is a good image format for photos and GIF is an animation format. Photoshop Elements can edit all of them. 3. Edit When you edit a picture, it is in an edit mode. Elements has nine types of edit modes and Photoshop Elements has seven types of edit modes. Solid colors are colors. Saturation is the amount of color in an area. Intensity is the brightness. All these are edit modes. Dynamic range is the difference between the brightest and darkest areas in the picture. Details are the amount of fine detail in an area. Detail is how well-defined an area is. Curves is a curve-based correction. Aperture is for pictures taken with a digital camera. Shutter is for pictures taken with a mechanical camera. These are two special kind of edit modes. 4. Color Elements has advanced tools for adjusting color. Hue and Saturation are the basic tools to color. To do this, you drag the circle slider to adjust these

tools. Hue is the color on the left. Saturation is the amount of color on the right. Saturation adds some color, but lower saturation means brighter. Some photos use color adjustment, so you will have to practice. If you have some digital photos, you can download a plug-in called Photoshop Mix Color that makes

"Describe location, topography, climate, human impact and natural processes." This is what Yahoo! Answers told the community on October 19, 2002. [1] Tropical and sub-tropical oceanic islands that vary in latitude from 12 to 40 degrees north (see list of islands below). Oceanic islands are characterized by steep slopes often containing active volcanoes. Given these constraints, most islands are fairly small - their diameters typically range from 0.9-2.0 km. The total island area of the world is about 22 million square kilometers. The largest island in the world is Greenland. The second largest is Madagascar. Islands are either volcano formed, subduction zone formed, or rise from seabed. Subduction zone formed islands include: Gambier Islands, Marquesas Islands, Marshall Islands, New Zealand and some volcanic islands in Alaska. Vesicular reef islands: On coral reefs, isolated reef areas that have the form of rounded islands growing out of a sea floor that stretches away from the island. A few are large enough to be called atolls. The largest of these are the Maldives, Tuamotu atolls, and Johnston Atoll. There are at least 6,500 named reef islands in the world, of which about 600 are inhabited by permanent residents. Volcanic islands: Oceanic islands are usually formed by volcanic activity. Usually an island is formed when there is a volcanic vent in the vicinity of sea floor. Then lava cools very rapidly, producing steep slopes. Some volcanic islands have been formed as the result of repeated lava flow from a single vent. But usually the land rises from multiple vents. These islands can be relatively close together, with a narrow gap separating the islands. The largest of these are the Hawaiian Islands. In areas of active volcanism, many of the islands and seamounts are marked by cones and lava flows. Sometimes fresh rock falls from large spherule-like boulders called scoriae. They fall frequently as volcanic eruptions occur, at intervals of several decades. Natural sea-level channels cut through the area of the ocean between two sets of volcanic islands. Some of these channels are marked by deep water channels that are only open to the seawater during the high sea. Between the two sets of islands lie various types of islands, ranging from very large and distant to less numerous and smaller. Some of the closer islands are
