The advantage of working with a software team is that there are multiple people working on one project. Photoshop, and other software tools, allow teams to work simultaneously without interfering with the other team's progress. Access collaboration tools: The online portfolio tools online portfolio tools allow you to work with professional team members through a Web-based workspace while sharing files with teams and the public. Building a website, a custom logo, or an animated video takes collaboration software tools to the next level. Keep track of your team: Collaboration software keeps track of files that are used in the project, and this information is displayed to everyone. If a team member is offline or doesn't have access to a computer, the system will retain the status of the file. Keep files private: When a project is finished, all members of the team can share their work for review. The files are retained for review or alternate versions of the files can be shown as new files on the group list. Watch over changes: If a team member is offline or does not have access to a computer, the system will retain the status of the file. Managing Projects Managing the time and resources you have to complete a project is the art of project management. Planning to take the time to edit a file is one thing, but actually doing it is another. Learning how to better manage time and resources takes practice and experience, but many people learn over time. It's important to get started early to

Differential effects of cord blood cell transplants in a mouse model of spinal cord injury. Little evidence has been provided for the role of hematopoietic cells in the inflammatory response of spinal cord injury (SCI). Our study investigated the effect of intra-spinal grafting of rat cord blood (CB) cells on locomotor recovery and inflammation following contusive SCI in adult mice. Seven and twenty-one days following the injury, the number of microglia/macrophages (Iba-1) and astrocytes (GFAP) were counted within the lesion border zone. Real-time PCR quantified levels of pro- and anti-inflammatory cytokine expression. The number of Iba-1 positive cells increased 21 days following the lesion, whereas GFAP increased only 7 days following injury. Although the presence of donor hematopoietic cells had no effect on either macrophage or astrocyte infiltration on day 7, increases in GFAP-positive astrocytes were observed in the co-transplanted group as compared to controls, which could be contributing to the recovery of hind-limb locomotor function. Heme arginate, a synthetic analog of hemoglobin, exhibits the biological activities of erythropoietin and prolongs life in hemolytic anemia models in rats. The synthesis of a heme arginate-rich protein to selectively induce hematopoiesis is described. Heme arginate is synthesized by culturing the bacteria *E. coli*, which produces a heme arginate protein containing an arginine heme-binding site. This synthesis method is based on the postulate that the regulation of heme arginate synthesis occurs at the transcriptional level. Heme arginate was extracted from the *E. coli* cells and used as a heme source. Treatment of rats with heme arginate, erythropoietin, or heme arginate followed by erythropoietin significantly increased the number of reticulocytes and the number of erythrocytes per cell, showing similar erythropoietin activity to that of erythropoietin *in vitro* and *in vivo*. Heme arginate-treated rats showed more rapid growth and greater activity than normal rats, and heme arginate-treated rats survived significantly longer than normal or erythropoietin-treated rats.
