For an architect, AutoCAD is often the ultimate tool for working with design drawings. It allows you to create 2D and 3D diagrams, as well as 2D and 3D drawings, models, drawings with dimensions and drawings of weldments. It is also widely used by draftsmen and other designers. Today, there are numerous applications of AutoCAD available. Architectural CAD programs are one of them. Architectural CAD programs offer facilities for three-dimensional modeling of buildings and other types of 3D designs. What is Architectural CAD? An Architectural CAD package consists of a software application for creating architectural drawings and associated images. These are more often referred to as 2D or 2D drawings, or as plans. An architectural plan can include building or site plans, room plans, elevations, cross-sections, site survey drawings, section lines, site plans, and many other 2D drawings. Architectural CAD packages also offer the following types of tools: Clad and trim tools: tools to prepare and position the type of cladding or trim you are going to use in a building. Auto contour tools: tools to create the 3D contours of the facades and roofs of buildings. Lofting tools: tools to design and position the loft beams. Architectural and Engineering software is often associated with computer-aided design, CADD, and drafting. Architectural CAD tools, however, are used to create 2D architectural drawings or plans. These tools can perform 3D modeling, but they are still designed to aid the designer when it comes to the creation of 2D drawings or plans. What is an Architectural CAD Package?
