Autodesk's objective is to provide high-quality, useful and affordable software, enhancing productivity and providing a competitive advantage for its customers. Contents show] History The AutoCAD History series covers the history of AutoCAD and key moments in AutoCAD's development, including the transition from the original 1982 AutoLISP platform to the current.NET based platform. Autodesk hired Ken Garland, whose experience designing software for the U.S. Air Force led him to consider the prospect of a new multi-user CAD system. At the same time he had also been convinced by an article in M.I.T. News that the demands of mainframe applications for CAD users would create a new market segment. Since the article suggested that the mainframe was not a suitable computer for CAD, he reasoned that "desktop" computer was a better choice. When he joined the company, Garland noticed that the only CAD system he could find was a single user system based on auto-plotting. It did not support the concept of multiple users, let alone multiple CAD operators working at the same time. This resulted in the first prototype for a system that would support multiple users. The key concept of this prototype was to have each user operate a "cursor" that held the state of all the drawing tools available to the user. This "cursor" would be linked to another object, the "palette" which held all of the tool parameters that could be modified by the user. This approach eliminated the need for a separate operator console or keyboard. Garland saw this prototype working on a DEC PDP-11 microcomputer in 1982. He was looking for a big multi-user CADD program that would run on a personal computer. The DEC PDP-11 was not that big. It was not a typical personal computer that one would have at home. He realized that his single user system would be far better for the average CADD user than the "big" CAD programs that had come before it. Garland was confronted with a problem: he did not have a good development team. His team was not large and was not very experienced. He did not have a lot of development time available, especially since the CADD market was still new and nothing comparable to AutoCAD existed. Garland realized that there was not a lot of research that could be done and it would be easy to obtain CAD software from many existing companies. He needed to

The fatwa says that any computer should be used as an aid for the purposes of teaching, writing, and research, but not as an amusement, a hindrance to the work process, or a source of distraction. It also says that the teacher should ensure that students do not waste time chatting with friends or surfing the internet. The deputy head of the academy, Ahmed Taha, told the daily Al-Hayat that the fatwa was issued after the government banned the sale of video games to students under the age of 15. Taha said that the academy had also issued a fatwa against the use of mobiles for any purpose in the classroom. "Mobile phones, computers, and video games are a main cause of delinquency and distraction in schools, and if these are not limited in the classroom, they will be in other areas such as the office and on the playground." The fatwa was issued in response to the current curriculum, which makes no provision for the use of a computer in the classroom. "The ministry of education has decided to place computers in the classroom to assist students in learning, but this is done without any plan or a system," Taha said. He said that the IFA does not object to the use of computers for certain purposes in the classroom, such as when teachers are teaching the subjects they themselves study. The spokesman for the Ministry of Education, Ibrahim al-Khouli, said that the ministry had made no decision about the use of computers in the classroom. "However, we are asking for a fat
