Resetter Epson Stylus Photo Tx700w Rar

Why the images come out blurry on the Canon SX124? All: I have a Canon SX124. I bought this printer about a year ago, and have upgraded the toner cartridge twice since then (removal + replacement). Now all of a sudden the pictures come out blurry. Just to start by saying, it's not the ISO setting. My main camera is a Canon 760D. There is no problem printing pictures

from my computer. I have done a full reset and it did not help. Any suggestions? Answer: Canon SX124 blurry pictures Question: My new Epson Stylus Photo TX700W is not printing/scanning documents properly.. My first few test prints came out fine, but after that, all the printed pages have a "Line Block" on the bottom and randomly the document is printed on the back of the paper (although it shouldn't be). I thought it was the printer because I just replaced the print head with the new version (that is also when I got the Line Block issue). However, I've tried both troubleshooting options on the Epson web site and they don't work either: First I ran the program "Epson TX700W Reset" and it listed all the tests, but when I ran "Operating System Test (EPSON TX700W)" it said, "nothing to do" right after I choose "the printer has been successfully reset" (though I pressed OK). After that, I ran the test "Reset Pending Tasks" which said, "errors found" and "diag not found". I'd choose "close" and "apply". Then, I checked to make sure the yellow "check" symbol is next to all the tasks (I don't know how it could work if it didn't). It was next to all of them, though at least one was yellow. So, I tried "enable" on all

of them. It didn't make any difference. I also tried printing some of the task 1 test pages, but it is very slow and prints only about half of the page before it stops with either errors or a blank page. If I choose "full resets" from the printer options, it goes all the way to the end of the test, but even then it comes out with errors or blank pages. What I tried so far. Please help! Thanks!
