Celebrities And Public Figures. The present invention relates to a method of operating a baghouse filter having a housing and a bag filter element, a suction line formed in the housing for taking in, in an air supply line, dust-laden air which is to be purified in the filter. A baghouse filter of this type is known from DE 195 25 453 B4, wherein the filter housing is formed as a housing body with a rectangular cross-

section, which is provided with vertical rigid walls and includes a filter cover which can be closed off by a cap. The filter housing contains the filter bag and is divided by at least one partition wall into a plurality of filter compartments, wherein the filter compartments can be ventilated via at least one ventilation opening arranged opposite the filter cover. The outlet air duct of the baghouse filter is formed

in the same housing, as are the air inlet connections for the suction of the air supply line. The air inlet connections are formed by vertical slots in the partition wall, which are accessible at the filter cover when the filter cover is closed off. Thus, when the filter cover is opened, the air inlet connections can be placed into a communication connection with the air supply line of the

baghouse filter. With this baghouse filter, a bag filter element can be removed from the housing in a working step and replaced with another bag filter element. The partitions of the housing are removable, at least in c6a93da74d
