A common concern of Photoshop's users is the time they need to spend re-arranging a document to maximize its use. Every time you change the order in which you have arranged a series of text, graphics, or layers, the organization changes. Often you might need to reset the arrangement of a myriad of layers to create a consistent look. This is so annoying that you will wrack your brain for hours trying to create a logical arrangement that suits your needs. I like the new font panels that extend the character family and display a type designer's assumptions about how a font should look and feel. Those that embrace them can build characters more efficiently and ported to other programs, like Adobe Illustrator, in a matter of minutes. There's a reason that the millions of designers using Adobe Photoshop spend countless hours arranging layers. Once your document is set up, you want your finished image to look great from edge to edge. The more time you spend building a layout, the greater the likelihood that you'll grow dissatisfied with its appearance and change it until it fits your needs. The new layers panel will help you quickly reorganize layout elements. With the new feature, you can quickly and easily rearrange layers, or correct matter such as an alignment shift. In my work, I'm constantly playing with fonts and text. Photoshop has great tools to help me do this quickly and easily: glyph panels with the placeholders and the glyphs, the built-in library and the ability to create personal fonts from the thousands of free fonts available.

It is now a little more clear what each icon do. Also, there is now a “recycle bins” icon on the left side of the Bridge window after making any changes. Selection tools. Now you can not only select objects on a layer or path in your image, but you can also select objects on layers in the same or other images. Previously, you could only select objects in a single image. Adobe Photoshop now has a new Content-Aware option which recognizes parts of your image that can be repeated and fill in the empty areas. This can be a great time-saver when combined with Object Selection and the Remove Background option. With the traditional Bracket selection, Content-Aware Fill ignores the whole image. With the Content-Aware Fill option, it only works on areas that you have already selected. It is a great option for people who want to make their photo look unified, or that has a set of objects that appear in the same part of the photo. With either selection, you can toggle this option on and off from the Content-Aware command found on the right of the Layers panel.
