The present invention relates to fluid pressure control valves and more particularly to a diaphragm mounted valve wherein the valve element is biased toward an open position by a diaphragm which is subject to pressure from the medium flowing through the valve. Various valve constructions of the type with which the present invention is concerned are shown in the prior art including U.S. Pat. Nos. 3,523,440; 3,589,569 and 4,043,409. The above mentioned patents illustrate the fact that it is well known to provide a valve construction of the type herein involved wherein the valve element is seated in a valve housing by pressure fluid pressure which forces the valve element into the closed position against the seat. In the event that the seat is relieved of the valve element, the valve element is forced by the fluid pressure back into the open position. Although diaphragm mounted valves of the type with which the present invention is concerned have been well known and are widely used, the prior art valves have not been entirely satisfactory. For example, in the above noted prior art patents, the diaphragm members are essentially planar members and are mounted on the valve housing with their planar surface adjacent f988f36e3a
