Adobe MacBook users with Retina display may have noticed the unintentional fact that the last color added to a selection will now fill in a gradation of colors, which, under some circumstances, changes which color would become the base color. This is nothing new from the AI doing what it does best - automate. When experimenting with AI, it may try to match the existing color (often a valid for photo work, but not often applicable) to anything between the current color and the next color that "makes sense". This may mean that a selection of color 1 becomes green and a new one of color 2 becomes red. Trout Fishing is a new Photoshop keyboard shortcut when you scroll upward from a normal numeric keypad keyboard. Long pressing the arrow keys with a text or picture selection will allow you to trim that selection. Short pressing the arrow keys without a selection will trim that selection. Something new for Lightroom users is drag & drop of photos into palettes. You can set each photo as a series of a gradient of colors that is used to return that photo back to - for example - black with a slight gradient towards yellow. This can help with, say, skin condition colors without having to use Hue or Saturation adjustments. This works well, as it's different than the previous Lightroom feature of dragging photos directly onto a palette. The new Live Diversity function appears in a new panel. It can scan your current image and suggest auto corrections that are applied to a new exposure adjustment or other settings, such as an etching effort. The suggestions appear as a dialogue box with a slider bar that adjusts how much diversity is suggested are applied.

Another block of color to which you can add or remove is the Background. With the Quick Selection tool, you can select a large area of the image easily. Change the color of the area, and add a background. The Marquee tool lets you highlight an area of the image and then add a frame or border around it. You can also use the Marquee tool to quickly copy a portion of the image. You'll use sharpness controls in the Adjustments panel to magnify parts of an image and the Lens Correction panel to re-create the look of an old-fashioned lens on your camera. Even though it's familiar to photographers, this panel offers much more than those old lenses. For example, the Lens Correction panel The Lens Correction panel allows you to easily change the focal length (or zoom) on your camera or lens to digitally create a wide or close-up shot. You can also use the Lab setting to manipulate the colors on your photo. For example, you can use the Color Balance panel or the Levels panel to give your photos a more pleasing look. The cool thing about levels is that you get to control the sensitivity of the balance. Even though it's called Photoshop, it's not just for creating photos; it can also create beautiful, satisfying, and eye-catching digital art. The following are a few ideas to get you started creating:

- Do a website design.
- Create a logo.
- Create a flyer, brochure, or press kit.
- Design a poster, banner, or ad.
- Design your business card or stationery.
- Create a layout, poster, or wrapping paper design.
