This version of Photoshop has effectively replaced Photoshop CS6, which is now out of mainstream support. I found the interface well organized, with the old “pen tool” being merged into the shape tool, aligners and direct selection tools with the changes made intuitive, detailed layers much easier to manage, and most importantly, the new slice tool that enables you to crop and move images is awesome. You can see my full review here . Photoshop has had an ups and downs over the years. It’s had its good moments and some of its worst times. But I hope these comments give you a better idea of what to expect and some peace of mind. I love Pixelmator, but in these times of proliferation the Adobe suite has become the most reliable choice for a newbie. I think it’s better to use the newer version of Photoshop if you have the money. You save the cost of purchasing the older version in the long run, and you save support cost from upgrading. It is worthy to note that the image editor does not include all of the features of the Adobe suite. Therefore, it is advisable that photographers opt to use a multi-purpose software offered by a vendor like Canva. On the other hand, image editing is specific to Photoshop and therefore it cannot be replaced with the iOS platform. Adobe Camera RAW: I’m not a fan of the main advantages of the new Nik Collection, namely Adobe Camera Raw. I can handle the annoying limitations as a pro photographer who understands how long it takes to convert RAW files into photographs. The result is that I have no problem breaking a RAW file into layers and applying adjustments on each layer. The result is that the image sharpness and color gets transferred to the background layer, allowing me to work on other aspects of the file. For example, I can use Nik Color Efex 4 to remove unwanted highlights, shadows etc.

I'm a creative services consultant who fuels and transforms advertising agencies' production-line workflow. Photoshop is the most powerful software an agency can dedicate to an art director so I really loved shooting the bluescreen template in its entirety. Considering I was shooting three different bluescreens at once, the workflow was quite straightforward: Then I created a whiteboard with Photoshop markers (see guide on How to Shoot a Live Whiteboard in Photoshop) and stored blueprints and assignments in Notes. It's as simple as it is powerful, and I'm a big fan. Here's a brief guide on how to create a whiteboard inside Photoshop: There are some really cool new Adobe features in the works as well. The new Document Sets feature creates groups of linked Photoshop documents that you can view and work from directly in Photoshop. Users with macOS High Sierra (v10.13) and newer can optionally sync these files to iCloud Drive, which are available offline. Designers are constantly on the go and don't always have access to an external computer or monitor. Good news: Adobe Photoshop now comes with the capability to work from an iPad's built-in display. With the Display Contextual Menu you can drag any object on the canvas, or open the context menu to change any setting simply by using the arrow keys. The Menu Bar also includes previously hard-to-find tools like the new Pen Selection tool. You'll notice when you're using it that it works differently than other tools: to select an area in the path of a drawing, use the Paths panel to draw a new selection around the area you want to work with. Here's how to access Photoshop on a machine without an internal monitor via a touchscreen:

ABOUT SUNEffects of an entomopathogenic fungus (*Hirsutella thompsonii*) on *Aedes aegypti* (Linnaeus, 1762) (Diptera; Culicidae) in southern Brazil. An entomopathogenic fungus, *Hirsutella thompsonii*, was evaluated against *Anopheles gambiae* and *Culex quinquefasciatus* using larval bioassays with and without solar radiation. *H. thompsonii* was active against both mosquito species in the absence of solar radiation (EC<sub>50</sub> = 7.03, 95% CI = 5.66-8.60 mg/L; and EC<sub>50</sub> = 16.94, 95% CI = 13.96-20.52 mg/L, respectively) but significantly reduced larval survival at a concentration of 5.0 mg/L (p < 0.05) when heat was applied (4°C/80% RH). The formula used in the present study produced an EC<sub>50</sub> of 63.2 mg/L (95% CI = 55).
